BACKGROUND OF THE INVENTION

Cross-reference to Related Application

This is a divisional application of U.S.S.N. 09/210,330 filed
15 on December 11, 1998.

Field of the Invention

This invention relates to the field of molecular biology.
More specifically, this invention relates to novel fluorescent proteins,
20 cDNAs encoding the proteins and uses thereof.

Description of the Related Art

Fluorescence labeling is a particularly useful tool for marking a protein, cell, or organism of interest. Traditionally, a
25 protein of interest is purified, then covalently conjugated to a fluorophore derivative. For *in vivo* studies, the protein-dye complex is then inserted into cells of interest using micropipetting or a method of reversible permeabilization. The dye attachment and insertion steps, however, make the process laborious and difficult to control. An

WO 00/34318

PCT/US99/29291

alternative method of labeling proteins of interest is to concatenate or fuse the gene expressing the protein of interest to a gene expressing a marker, then express the fusion product. Typical markers for this method of protein labeling include β -galactosidase, firefly luciferase 5 and bacterial luciferase. These markers, however, require exogenous substrates or cofactors and are therefore of limited use for *in vivo* studies.

A marker that does not require an exogenous cofactor or substrate is the green fluorescent protein (GFP) of the jellyfish 10 *Aequorea victoria*, a protein with an excitation maximum at 395 nm, a second excitation peak at 475 nm and an emission maximum at 510 nm. GFP is a 238-amino acid protein, with amino acids 65-67 involved in the formation of the chromophore.

Uses of GFP for the study of gene expression and protein 15 localization are discussed in detail by Chalfie et al. in *Science* 263 (1994), 802-805, and Heim et al. in *Proc. Nat. Acad. Sci.* 91 (1994), 12501-12504. Additionally, Rizzuto et al. in *Curr. Biology* 5 (1995), 635-642, discuss the use of wild-type GFP as a tool for visualizing 20 subcellular organelles in cells, while Kaether and Gerdes in *Febs Letters* 369 (1995), 267-271, report the visualization of protein transport along the secretory pathway using wild-type GFP. The expression of GFP in plant cells is discussed by Hu and Cheng in *Febs Letters* 369 (1995), 331-334, while GFP expression in *Drosophila* embryos is described by Davis et al. in *Dev. Biology* 170 (1995), 726-729.

25 Crystallographic structures of wild-type GFP and the mutant GFP S65T reveal that the GFP tertiary structure resembles a barrel (Ormö et al., *Science* 273 (1996), 1392-1395; Yang, et al., *Nature Biotechnol* 14 (1996), 1246-1251). The barrel consists of beta sheets in a compact structure, where, in the center, an alpha helix containing

WO 00/34318

PCT/US99/29291

the chromophore is shielded by the barrel. The compact structure makes GFP very stable under diverse and/or harsh conditions such as protease treatment, making GFP an extremely useful reporter in general. However, the stability of GFP makes it sub-optimal for 5 determining short-term or repetitive events.

A great deal of research is being performed to improve the properties of GFP and to produce GFP reagents useful and optimized for a variety of research purposes. New versions of GFP have been developed, such as a "humanized" GFP DNA, the protein product of 10 which has increased synthesis in mammalian cells (Haas, et al., *Current Biology* 6 (1996), 315-324; Yang, et al., *Nucleic Acids Research* 24 (1996), 4592-4593). One such humanized protein is "enhanced green 15 fluorescent protein" (EGFP). Other mutations to GFP have resulted in blue-, cyan- and yellow-green light emitting versions. Despite the great utility of GFP, however, other fluorescent proteins with properties similar to or different from GFP would be useful in the art. Novel 20 fluorescent proteins result in possible new colors, or produce pH-dependent fluorescence. Other benefits of novel fluorescent proteins include fluorescence resonance energy transfer (FRET) possibilities based on new spectra and better suitability for larger excitation.

The prior art is deficient in novel fluorescent proteins wherein the DNA coding sequences are known. The present invention fulfills this long-standing need in the art.

25

SUMMARY OF THE INVENTION

The present invention is directed to DNA sequences encoding fluorescent proteins selected from the group consisting of:

WO 00/34318

PCT/US99/29291

(a) an isolated DNA from an organism from the Class Anthozoa which encodes a fluorescent protein; (b) an isolated DNA which hybridizes to the isolated DNA of (a) and which encodes a fluorescent protein; and (c) an isolated DNA differing from the isolated DNAs of (a) and (b) in 5 codon sequence due to the degeneracy of the genetic code and that encodes a fluorescent protein. Preferably, the DNA is isolated from a non -bioluminescent organism from Class Anthozoa. More preferably, the DNA has the sequence selected from the group consisting of SEQ ID Nos. 55, 57-60, and the fluorescent protein has the amino acid 10 sequence shown in SEQ ID No. 56.

In another embodiment of the present invention, there is provided a vector capable of expressing the DNA of the present invention in a recombinant cell comprising said DNA and regulatory elements necessary for expression of the DNA in the cell. Preferably, 15 the DNA encodes a fluorescent protein having the amino acid sequence shown in SEQ ID No. 56.

In still another embodiment of the present invention, there is provided a host cell transfected with a vector of the present invention, such that the host cell expresses a fluorescent protein. 20 Preferably, the cell is selected from the group consisting of bacterial cells, mammalian cells, plant cells and insect cells.

The present invention is also directed to an isolated and purified fluorescent protein coded for by DNA selected from the group consisting of: (a) isolated DNA from an organism from Class Anthozoa 25 which encodes a fluorescent protein; (b) isolated DNA which hybridizes to the isolated DNA of (a) and which encodes a fluorescent protein; and (c) isolated DNA differing from the isolated DNAs of (a) and (b) in codon sequence due to the degeneracy of the genetic code, and which

WO 00/34318

PCT/US99/29291

encodes a fluorescent protein. Preferably, the protein has the amino acid sequence shown in SEQ ID No. 56.

The present invention is also directed to a DNA sequence encoding a fluorescent protein selected from the group consisting of:

5 (a) an isolated DNA which encodes a fluorescent protein, wherein said DNA is from an organism from Class Anthozoa and wherein said organism does not exhibit bioluminescence; (b) an isolated DNA which hybridizes to isolated DNA of (a) and which encodes a fluorescent protein; and (c) an isolated DNA differing from the isolated DNAs of

10 (a) and (b) in codon sequence due to degeneracy of the genetic code and which encodes a fluorescent protein. Preferably, the organism is from Sub-class Zoantharia, Order Zoanthidea. More preferably, the organism is from Sub-order Brachycnemina. Even more preferably, the organism is from Family Zoanthidae, Genus Zoanthus. Most

15 particularly, the present invention is drawn to a novel fluorescent protein from *Zoanthus sp.*, zFP506.

The present invention is further directed to an amino acid sequence which can be used as a basis for designing an oligonucleotide probe for identification of a DNA encoding a fluorescent protein by

20 means of hybridization, wherein the amino acid sequence is selected from the group consisting of SEQ ID Nos. 3, 5, 8, 11, 12, 14. Preferably, such an oligonucleotide has a nucleotide sequence selected from the group consisting of SEQ ID Nos. 4, 6, 7, 9, 10, 13, 15, 16.

Other and further aspects, features, and advantages of the

25 present invention will be apparent from the following description of the presently preferred embodiments of the invention given for the purpose of disclosure.

WO 00/34318

PCT/US99/29291

BRIEF DESCRIPTION OF THE DRAWINGS

Figure 1 shows the modified strategy of 3'-RACE used to isolate the target fragments. Sequences of the oligonucleotides used 5 are shown in Table 2. Dp1 and Dp2 are the degenerate primers used in the first and second PCR, respectively (see Tables 3 and 4 for the sequences of degenerate primers). In the case of *Zoanthus sp.*, the first degenerate primer used was NGH (SEQ ID No. 4), and the second degenerate primer used was GEGa (SEQ ID No. 6).

10 Figure 2 shows the excitation and emission spectrum of the novel fluorescent protein from *Zoanthus sp.*, zFP506.

Figure 3 shows functional analysis of destabilized zFP506. It demonstrates that fusion of MODC domain to the zFP506 slightly decreases the fluorescent intensity compared to zFP506 itself and that 15 transient transfection of destabilized zFP506 decreases the fluorescent intensity by 50% after 4-hour treatment with protein synthesis inhibitor cycloheximide (Figure 3B) vs. control (Figure 3A).

20

DETAILED DESCRIPTION OF THE INVENTION

As used herein, the term "GFP" refers to the basic green fluorescent protein from *Aequorea victoria*, including prior art versions of GFP engineered to provide greater fluorescence or fluoresce 25 in different colors. The sequence of *Aequorea victoria* GFP (SEQ ID No. 54) has been disclosed in Prasher et al., *Gene* 111 (1992), 229-33.

As used herein, the term "EGFP" refers to mutant variant of GFP having two amino acid substitutions: F64L and S65T (Heim et al., *Nature* 373 (1995), 663-664). The term "humanized" refers to changes

WO 00/34318

PCT/US99/29291

made to the GFP nucleic acid sequence to optimize the codons for expression of the protein in human cells (Yang et al., *Nucleic Acids Research* 24 (1996), 4592-4593).

As used herein, the term "NFP" refers to novel fluorescent protein, and the term "GNFP" refers to green novel fluorescent protein. Specifically, "GNFP" refers to zFP506.

In accordance with the present invention there may be employed conventional molecular biology, microbiology, and recombinant DNA techniques within the skill of the art. Such techniques are explained fully in the literature. See, e.g., Maniatis, Fritsch & Sambrook, "Molecular Cloning: A Laboratory Manual" (1982); "DNA Cloning: A Practical Approach," Volumes I and II (D.N. Glover ed. 1985); "Oligonucleotide Synthesis" (M.J. Gait ed. 1984); "Nucleic Acid Hybridization" (B.D. Hames & S.J. Higgins eds. (1985)); "Transcription and Translation" (B.D. Hames & S.J. Higgins eds. (1984)); "Animal Cell Culture" (R.I. Freshney, ed. (1986)); "Immobilized Cells and Enzymes" (IRL Press, (1986)); B. Perbal, "A Practical Guide To Molecular Cloning" (1984).

A "vector" is a replicon, such as plasmid, phage or cosmid, to which another DNA segment may be attached so as to bring about the replication of the attached segment.

A "DNA molecule" refers to the polymeric form of deoxyribonucleotides (adenine, guanine, thymine, or cytosine) in either single stranded form or a double-stranded helix. This term refers only to the primary and secondary structure of the molecule, and does not limit it to any particular tertiary forms. Thus, this term includes double-stranded DNA found, inter alia, in linear DNA molecules (e.g., restriction fragments), viruses, plasmids, and chromosomes.

WO 00/34318

PCT/US99/29291

A DNA "coding sequence" is a DNA sequence which is transcribed and translated into a polypeptide in vivo when placed under the control of appropriate regulatory sequences. The boundaries of the coding sequence are determined by a start codon at 5 the 5' (amino) terminus and a translation stop codon at the 3' (carboxyl) terminus. A coding sequence can include, but is not limited to, prokaryotic sequences, cDNA from eukaryotic mRNA, genomic DNA sequences from eukaryotic (e.g., mammalian) DNA, and synthetic DNA sequences. A polyadenylation signal and transcription termination 10 sequence may be located 3' to the coding sequence.

As used herein, the term "hybridization" refers to the process of association of two nucleic acid strands to form an antiparallel duplex stabilized by means of hydrogen bonding between residues of the opposite nucleic acid strands.

15 The term "oligonucleotide" refers to a short (under 100 bases in length) nucleic acid molecule.

"DNA regulatory sequences", as used herein, are transcriptional and translational control sequences, such as promoters, enhancers, polyadenylation signals, terminators, and the like, that 20 provide for and/or regulate expression of a coding sequence in a host cell.

A "promoter sequence" is a DNA regulatory region capable of binding RNA polymerase in a cell and initiating transcription of a downstream (3' direction) coding sequence. For purposes of defining 25 the present invention, the promoter sequence is bounded at its 3' terminus by the transcription initiation site and extends upstream (5' direction) to include the minimum number of bases or elements necessary to initiate transcription at levels detectable above background. Within the promoter sequence will be found a

WO 00/34318

PCT/US99/29291

transcription initiation site, as well as protein binding domains responsible for the binding of RNA polymerase. Eukaryotic promoters will often, but not always, contain "TATA" boxes and "CAT" boxes. Various promoters, including inducible promoters, may be used to
5 drive the various vectors of the present invention.

As used herein, the terms "restriction endonucleases" and "restriction enzymes" refer to bacterial enzymes, each of which cut double-stranded DNA at or near a specific nucleotide sequence.

A cell has been "transformed" or "transfected" by
10 exogenous or heterologous DNA when such DNA has been introduced inside the cell. The transforming DNA may or may not be integrated (covalently linked) into the genome of the cell. In prokaryotes, yeast, and mammalian cells for example, the transforming DNA may be maintained on an episomal element such as a plasmid. With respect to
15 eukaryotic cells, a stably transformed cell is one in which the transforming DNA has become integrated into a chromosome so that it is inherited by daughter cells through chromosome replication. This stability is demonstrated by the ability of the eukaryotic cell to establish cell lines or clones comprised of a population of daughter
20 cells containing the transforming DNA. A "clone" is a population of cells derived from a single cell or common ancestor by mitosis. A "cell line" is a clone of a primary cell that is capable of stable growth *in vitro* for many generations.

A "heterologous" region of the DNA construct is an
25 identifiable segment of DNA within a larger DNA molecule that is not found in association with the larger molecule in nature. Thus, when the heterologous region encodes a mammalian gene, the gene will usually be flanked by DNA that does not flank the mammalian genomic DNA in the genome of the source organism. In another example,

WO 00/34318

PCT/US99/29291

heterologous DNA includes coding sequence in a construct where portions of genes from two different sources have been brought together so as to produce a fusion protein product. Allelic variations or naturally-occurring mutational events do not give rise to a 5 heterologous region of DNA as defined herein.

As used herein, the term "reporter gene" refers to a coding sequence attached to heterologous promoter or enhancer elements and whose product may be assayed easily and quantifiably when the construct is introduced into tissues or cells.

10 The amino acids described herein are preferred to be in the "L" isomeric form. The amino acid sequences are given in one-letter code (A: alanine; C: cysteine; D: aspartic acid; E: glutamic acid; F: phenylalanine; G: glycine; H: histidine; I: isoleucine; K: lysine; L: leucine; M: methionine; N: asparagine; P: proline; Q: glutamine; R: arginine; S: 15 serine; T: threonine; V: valine; W: tryptophane; Y: tyrosine; X: any residue). NH₂ refers to the free amino group present at the amino terminus of a polypeptide. COOH refers to the free carboxy group present at the carboxy terminus of a polypeptide. In keeping with standard polypeptide nomenclature, *J Biol. Chem.*, 243 (1969), 3552-20 59 is used.

The present invention is directed to an isolated DNA selected from the group consisting of: (a) isolated DNA from an organism from the Class Anthozoa which encodes a fluorescent protein; (b) isolated DNA which hybridizes to isolated DNA of (a) and 25 which encodes a fluorescent protein; and (c) isolated DNA differing from the isolated DNAs of (a) and (b) in codon sequence due to the degeneracy of the genetic code, and which encodes a fluorescent protein. Preferably, the DNA has the sequence selected from the group consisting of SEQ ID Nos. 55, 57-60, and the fluorescent protein has the

WO 00/34318

PCT/US99/29291

amino acid sequence shown in SEQ ID No. 56. More preferably, the DNA is non-humanized or humanized zFP506 or N65M.

In another embodiment of the present invention, there is provided a vector capable of expressing the DNA of the present invention in a recombinant cell comprising said DNA and regulatory elements necessary for expression of the DNA in the cell. Specifically, the DNA encodes a fluorescent protein having the amino acid sequence shown in SEQ ID No. 56. Preferably, the vector is constructed by amplifying the DNA and then inserting the amplified DNA into EGFP-N1 backbone, or by fusing different mouse ODC degradation domains such as d1, d2 and d376 to the C-terminal of the DNA and then inserting the fusion DNA into EGFP-N1 backbone.

In still another embodiment of the present invention, there is provided a host cell transfected with the vector of the present invention, which expresses a fluorescent protein of the present invention. Preferably, the cell is selected from the group consisting of bacterial cells, mammalian cells, plant cells, insect cells and yeast cells. A representative example of mammalian cell is HEK 293 cell and an example of bacterial cell is an *E. coli* cell.

The present invention is also directed to a DNA sequence encoding a fluorescent protein selected from the group consisting of: (a) an isolated DNA which encodes a fluorescent protein, wherein said DNA is from an organism from Class Anthozoa and wherein said organism does not exhibit bioluminescence; (b) an isolated DNA which hybridizes to isolated DNA of (a) and which encodes a fluorescent protein; and (c) an isolated DNA differing from the isolated DNAs of (a) and (b) in codon sequence due to degeneracy of the genetic code and which encodes a fluorescent protein. Preferably, the organism is from Sub-class Zoantharia, Order Zoanthidea. More preferably, the

WO 00/34318

PCT/US99/29291

organism is from Sub-order Brachycnemina. Even more preferably, the organism is from Family Zoanthidae, Genus Zoanthus.

The present invention is also directed to an isolated and purified fluorescent protein coded for by DNA selected from the group consisting of: (a) an isolated protein encoded by a DNA which encodes a fluorescent protein wherein said DNA is from an organism from Class Anthozoa and wherein said organism does not exhibit bioluminescence; (b) an isolated protein encoded by a DNA which hybridizes to isolated DNA of (a); and (c) an isolated protein encoded by a DNA differing from the isolated DNAs of (a) and (b) in codon sequence due to degeneracy of the genetic code. Preferably, the isolated and purified fluorescent protein is zFP506.

The present invention is further directed to an amino acid sequence which can be used as a basis for designing an oligonucleotide probe for identification of a DNA encoding a fluorescent protein by means of hybridization, wherein the amino acid sequence is selected from the group consisting of SEQ ID Nos. 3, 5, 8, 11, 12, 14. Preferably, such an oligonucleotide has a nucleotide sequence selected from the group consisting of SEQ ID Nos. 4, 6, 7, 9, 10, 13, 15, 16 and is used as a primer in polymerase chain reaction. Alternatively, it can be used as a probe for hybridization screening of the cloned genomic or cDNA library.

The following examples are given for the purpose of illustrating various embodiments of the invention and are not meant to limit the present invention in any fashion.

WO 00/34318

PCT/US99/29291

EXAMPLE 1**Biological Material**

Novel fluorescent proteins were identified from several
5 genera of Anthozoa which do not exhibit any bioluminescence but have
fluorescent color as observed under usual white light or ultraviolet
light. Six species were chosen (see Table 1).

WO 00/34318

PCT/US99/29291

TABLE 1Anthozoa Species Used in This Study

Species	Area of Origination	Fluorescent Color
Anemonia majano	Western Pacific	bright green tentacle tips
Clavularia sp.	Western Pacific	bright green tentacles and oral disk
Zoanthus sp.	Western Pacific	green-yellow tentacles and oral disk
Discosoma sp. "red"	Western Pacific	orange-red spots oral disk
Discosoma striata	Western Pacific	blue-green stripes on oral disk
Discosoma sp. "magenta"	Western Pacific	faintly purple oral disk
Discosoma sp. "green"	Western Pacific	green spots on oral disk
Anemonia sulcata	Mediterranean	purple tentacle tips

WO 00/34318

PCT/US99/29291

EXAMPLE 2**cDNA Preparation**

Total RNA was isolated from the species of interest according to the protocol of Chomczynski and Sacchi (Chomczynski P., et al., *Anal. Biochem.* 162 (1987), 156-159). First-strand cDNA was synthetized starting with 1-3 µg of total RNA using SMART PCR cDNA synthesis kit (CLONTECH) according to the provided protocol with the only alteration being that the "cDNA synthesis primer" provided in the kit was replaced by the primer TN3 (5'- CGCAGTCGACCG(T)₁₃, SEQ ID No. 1) (Table 2). Amplified cDNA samples were then prepared as described in the protocol provided except the two primers used for PCR were the TS primer (5'-AAGCAGTGGTATCAACGCAGAGT, SEQ ID No. 2) (Table 2) and the TN3 primer (Table 2), both in 0.1 µM concentration. Twenty to twenty-five PCR cycles were performed to amplify a cDNA sample. The amplified cDNA was diluted 20-fold in water and 1 µl of this dilution was used in subsequent procedures.

EXAMPLE 3**Oligo Design**

To isolate fragments of novel fluorescent protein cDNAs,
5 PCR using degenerate primers was performed. Degenerate primers
were designed to match the sequence of the mRNAs in regions that
were predicted to be the most invariant in the family of fluorescent
proteins. Four such stretches were chosen (Table 3) and variants of
degenerate primers were designed. All such primers were directed to
10 the 3'-end of mRNA. All oligos were gel-purified before use. Table 2
shows the oligos used in cDNA synthesis and RACE.

WO 00/34318

PCT/US99/29291

EXAMPLE 4**Isolation of 3'-cDNA Fragments of nFPs**

The modified strategy of 3'-RACE was used to isolate the target fragments (see Figure 1). The RACE strategy involved two consecutive PCR steps. The first PCR step involved a first degenerate primer (Table 4) and the T7-TN3 primer (SEQ ID No. 17) which has a 3' portion identical to the TN3 primer used for cDNA synthesis (for sequence of T7-TN3, Table 2). The reason for substituting the longer T7-TN3 primer in this PCR step was that background amplification which occurred when using the shorter TN3 primer was suppressed effectively, particularly when the T7-TN3 primer was used at a low concentration (0.1 μ M) (Frohman et al., (1998) *PNAS USA*, 85, 8998-9002). The second PCR step involved the TN3 primer (SEQ ID No. 1, Table 2) and a second degenerate primer (Table 4).

WO 00/34318

PCT/US99/29291

TABLE 4

Combinations of Degenerate Primers for First and Second PCR Resulting in Specific Amplification of 3'-Fragments of nFP cDNA

Species	First Degenerate Primer	Second Degenerate Primer
<i>Anemonia majano</i>	NGH (SEQ ID No. 4)	GNGb (SEQ ID No. 10)
<i>Clavularia</i> sp.	NGH (SEQ ID No. 4)	GEGa (SEQ ID No. 6)
<i>Zoanthus</i> sp.	NGH (SEQ ID No. 4)	GEGa (SEQ ID No. 6)
<i>Discosoma</i> sp. "red"	NGH (SEQ ID No. 4)	GEGa (SEQ ID No. 6), NFP (SEQ ID No. 13) or PVMb (SEQ ID No. 16)
<i>Discosoma striata</i>	NGH (SEQ ID No. 4)	NFP (SEQ ID No. 13)
<i>Anemonia sulcata</i>	NGH (SEQ ID No. 4)	GEGa (SEQ ID No. 6) or NFP (SEQ ID No. 13)

5

The first PCR reaction was performed as follows: 1 μ l of 20-fold dilution of the amplified cDNA sample was added into the reaction mixture containing 1X Advantage KlenTaq Polymerase Mix with provided buffer (CLONTECH), 200 μ M dNTPs, 0.3 μ M of first degenerate

WO 00/34318

PCT/US99/29291

primer (Table 4) and 0.1 μ M of T7-TN3 (SEQ ID No. 17) primer in a total volume of 20 μ l. The cycling profile was (Hybaid OmniGene Thermocycler, tube control mode): 1 cycle for 95°C, 10 sec.; 55°C, 1 min.; 72°C, 40 sec; 24 cycles for 95°C, 10 sec.; 62°C, 30 sec.; 72°C, 40 sec. The reaction was then diluted 20-fold in water and 1 μ l of this dilution was added to a second PCR reaction, which contained 1X Advantage KlenTaq Polymerase Mix with the buffer provided by the manufacturer (CLONTECH), 200 μ M dNTPs, 0.3 μ M of the second degenerate primer (Table 4) and 0.1 μ M of TN3 primer. The cycling profile was (Hybaid OmniGene Thermocycler, tube control mode): 1 cycle for 95°C, 10 sec.; 55°C (for GEG/GNG or PVM) or 52°C (for NFP), 1 min.; 72°C, 40 sec; 13 cycles for 95°C, 10sec.; 62°C (for GEG/GNG or PVM) or 58°C (for NFP), 30 sec.; 72°C, 40 sec. The product of PCR was cloned into PCR-Script vector (Stratagene) according to the manufacturer's protocol.

Different combinations of degenerate primers were tried in the first and second PCR reactions on the DNA from each species until a combination of primers was found that resulted in specific amplification--meaning that a pronounced band of expected size (about 650-800 bp for NGH and GEG/GNG and 350-500 bp for NFP and PVM--sometimes accompanied by a few minor bands) was detected on agarose gel after two PCR reactions. The primer combinations of choice for different species of the Class Anthozoa are listed in Table 4. Some other primer combinations also resulted in amplification of fragments of correct size, but the sequence of these fragments showed no homology to the other fluorescent proteins identified or to *Aequorea victoria* GFP.

WO 00/34318

PCT/US99/29291

EXAMPLE 5**Obtaining Full-Length cDNA Copies**

Upon sequencing the obtained 3'-fragments of novel 5 fluorescent protein cDNAs, two nested 5'-directed primers were synthesized for cDNA (Table 5), and the 5' ends of the cDNAs were then amplified using two consecutive PCRs. In the next PCR reaction, the novel approach of "step-out PCR" was used to suppress background amplification. The step-out reaction mixture contained 1x Advantage 10 KlenTaq Polymerase Mix using buffer provided by the manufacturer (CLONTECH), 200 µM dNTPs, 0.2 µM of the first gene-specific primer (see Table 5), 0.02 µM of the T7-TS primer (SEQ ID No. 18), 0.1 µM of T7 primer (SEQ ID No. 19) and 1 µl of the 20-fold dilution of the amplified cDNA sample in a total volume of 20 µl. The cycling profile 15 was (Hybaid OmniGene Thermocycler, tube control mode): 23-27 cycles for 95°C, 10 sec.; 60°C, 30 sec.; 72°C, 40 sec. The product of amplification was diluted 50-fold in water and one µl of this dilution was added to the second (nested) PCR. The reaction contained 1X Advantage KlenTaq Polymerase Mix with provided buffer (CLONTECH), 20 200 µM dNTPs, 0.2 µM of the second gene-specific primer and 0.1 µM of TS primer (SEQ ID No. 2) in a total volume of 20 µl. The cycling profile was (Hybaid OmniGene Thermocycler, tube control mode): 12 cycles for 95°C, 10 sec.; 60°C, 30 sec.; 72°C, 40 sec. The product of amplification was then cloned into pAtlas vector (CLONTECH) according 25 to the manufacturer's protocol.

WO 00/34318

PCT/US99/29291

TABLE 5**Gene-Specific Primers Used for 5'-RACE**

WO 00/34318

PCT/US99/29291

EXAMPLE 6**Expression of nFP in *E. coli***

5 To prepare a DNA construct for novel fluorescent protein expression, two primers were synthesized for each cDNA: a 5'-directed "downstream" primer with the annealing site located in the 3'-UTR of the cDNA and a 3'-directed "upstream" primer corresponding to the site of translation start site (not including the first ATG codon) (Table 10 6). Primers with SEQ ID Nos. 41 and 42 were the primers used to prepare the zFP506 DNA. Both primers had 5'-heels coding for a site for a restriction endonuclease; in addition, the upstream primer was designed so as to allow the cloning of the PCR product into the pQE30 vector (Qiagen) in such a way that resulted in the fusion of reading 15 frames of the vector-encoded 6xHis-tag and nFP. The PCR was performed as follows: 1 µl of the 20-fold dilution of the amplified cDNA sample was added to a mixture containing 1x Advantage KlenTaq Polymerase Mix with buffer provided by the manufacturer (CLONTECH), 200 µM dNTPs, 0.2 µM of upstream primer and 0.2 µM of downstream 20 primer, in a final total volume of 20 µl. The cycling profile was (Hybaid OmniGene Thermocycler, tube control mode): 23-27 cycles for 95°C, 10 sec.; 60°C, 30 sec.; 72°C, 40 sec. The product of this amplification step was purified by phenol-chlorophorm extraction and ethanol precipitation and then cloned into pQE30 vector using restriction 25 endonucleases corresponding to the primers' sequence according to standard protocols.

All plasmids were amplified in XL-1 blue *E. coli* and purified by plasmid DNA miniprep kits (CLONTECH). The recombinant clones were selected by colony color, and grown in 3 ml of LB medium

WO 00/34318

PCT/US99/29291

(supplemented with 100 µg/ml of ampicillin) at 37°C overnight. 100 µl of the overnight culture was transferred into 200 ml of fresh LB medium containing 100 µg/ml of ampicillin and grown at 37°C, 200 rpm up to OD₆₀₀ 0.6-0.7. 1 mM IPTG was then added to the culture and 5 incubation was allowed to proceed at 37°C for another 16 hours. The cells were harvested and recombinant protein, which incorporated 6x His tags on the N-terminus, was purified using TALON™ metal-affinity resin according to the manufacturer's protocol (CLONTECH).

EXAMPLE 7**Novel Fluorescent Proteins and cDNAs Encoding the Proteins**

One of the full-length cDNAs encoding fluorescent proteins found is described herein (zFP506). The nucleic acid sequence and deduced amino acid sequence are SEQ ID Nos. 55 and 56, respectively. The spectral properties of zFP506 is listed in Table 7, and the emission and excitation spectra for the ZFP506 is shown in Figure 2.

10

TABLE 7**Spectral Properties of the Isolated zFP506 nFP**

Species:	Zoanthus sp.	Max. Extinction Coefficient:	35,600
15 nFP Name:	zFP506	Quantum Yield	0.63
Absorbance Max. (nm):	496	Relative Brightness:*	1.02
20 Emission Max. (nm):	506		

*relative brightness is extinction coefficient multiplied by quantum yield divided by the same value for *A. victoria* GFP.

25

EXAMPLE 8**Construction of zFP506 Mutant**

One mutant of zFP506 was generated, N65M. Compared with wild type zFP506, N65M has the mutation of from "AAC" to "ATG" which results in the corresponding amino acid change from Asparagine

WO 00/34318

PCT/US99/29291

(N) to Methionine (M) at the position of 65. The spectral properties of N65M are listed in Table 8.

*relative brightness is extinction coefficient multiplied by quantum yield divided by the same value for *A. victoria* GFP.

20

EXAMPLE 9**Construction and Functional Analysis of Vectors**

Non-humanized zFP506 DNA was amplified via PCR and
25 reconstructed into EGFP-N1 backbone. This vector has the same
multiple cloning sites as EGFP-N1.

Functional test of the generated vector was performed by
transient transfection in 293 cells. 24 hours post transfection,
expression of zFP506 was examined under fluorescent microscope.
30 zFP506 showed good fluorescent intensity and comparable to EGFP-N1.

WO 00/34318

PCT/US99/29291

EXAMPLE 10**Generation of Destabilized zFP506 Vectors as Transcription Reporters**

5 Since zFP506 is very stable, it is necessary to generate destabilized versions of zFP506 in order to observe the rapid turnover of the protein. By using the same technology for destabilized EGFP, two destabilized zFP506 vectors were constructed by fusing mouse ODC degradation domain to the C-terminal of zFP506. The d1 version of
10 destabilized zFP506 (SEQ ID No. 57) has three E to A mutations within MODC degradation domain comparing to d2 version (SEQ ID No. 58), therefore result in a shorter half-life of the protein to which MODC degradation domain fused to. Destabilized d1zFP506 and d2zFP506 were constructed in EGFP-N1 backbone

15

EXAMPLE 10**Functional Analysis of Destabilized zFP506**

20 Wildtype d1zFP506 was transiently transfected into 293 cells. 24 hours after transfection, CHX was added to stop protein synthesis. After 4 hour treatment, cells were examined under fluorescent microscope. It shows that fusion of MODC domain to the zFP506 slightly decreases the fluorescent intensity compared to zFP506
25 itself. After 4 hour treatment, there is 50% fluorescent intensity decrease (Figure 3B vs. Figure 3A).

WO 00/34318

PCT/US99/29291

EXAMPLE 11**Application of Destabilized d1zFP506 as Transcription Reporters**

Destabilized d1zFP506 was constructed into pCRE-d1GNFP and pNF- κ B-d1GNFP vectors. Its expression was regulated under cAMP response element (CRE) or NF- κ B response element, respectively. These vectors were transiently transfected into 293 cells, and 24 hours post transfection, the expression of d1GNFP was induced by Forskolin or TNF- α . 6 hours after induction, the culture was analysed by FACS. CRE-d1GNFP showed 7 fold of induction in fluorescence intensity, while 4 fold of induction was obtained in NF- κ B-d1GNFP (data not shown). This demonstrated that the destabilized form of GNFP is applicable as transcription reporters.

15

EXAMPLE 12**Construction and Functional Test for Humanized zFP506 and Humanized N65M**

Since mammalian expression is a very popular tool, human favored codon version is needed for better expression in mammalian cells. Each piece of human favored codon oligos was linked to form the full length of wild type and/or mutant zFP506 (hGNFP-zFP506, SEQ ID No. 59; hGNFP-N65M, SEQ ID No. 60). This humanized zFP506 was constituted into EGFP-N1 backbone.

reference to the same extent as if each individual publication was specifically and individually indicated to be incorporated by reference.

One skilled in the art will appreciate readily that the present invention is adapted to carry out the objects and obtain the ends and 5 advantages mentioned, as well as those objects and ends inherent therein. The present examples, along with the methods, procedures, treatments, molecules, and specific compounds described herein, are presently representative of preferred embodiments, are exemplary, and are not intended as limitations on the scope of the invention. Changes 10 to the methods and compounds, and other uses, will occur to those skilled in the art and are encompassed within the spirit of the invention as defined by the scope of the claims.

WO 00/34318

PCT/US99/29291

WHAT IS CLAIMED IS:

1. A DNA sequence encoding a fluorescent protein selected from the group consisting of:
 - 5 (a) an isolated DNA which encodes a fluorescent protein, wherein said DNA is from an organism from a Class Anthozoa and wherein said organism does not exhibit bioluminescence;
 - (b) an isolated DNA which hybridizes to isolated DNA of (a) above and which encodes a fluorescent protein; and
 - 10 (c) an isolated DNA differing from the isolated DNAs of (a) and (b) above in codon sequence due to degeneracy of the genetic code and which encodes a fluorescent protein.
2. The DNA sequence of claim 1, wherein said organism
15 is from Sub-class Zoantharia.
3. The DNA sequence of claim 2, wherein said organism is from Order Zoanthidea.
- 20 4. The DNA sequence of claim 3, wherein said organism is from Sub-order Brachycnemina.
5. The DNA sequence of claim 4, wherein said organism is from Family Zoanthidae.
25
6. The DNA sequence of claim 5, wherein said organism is from Genus Zoanthus.

WO 00/34318

PCT/US99/29291

7. A DNA sequence encoding a fluorescent protein selected from the group consisting of:

(a) an isolated DNA which encodes a fluorescent protein having a nucleotide sequence selected from the group consisting of SEQ

5 ID Nos. 55, 57-60;

(b) an isolated DNA which hybridizes to isolated DNA of (a) above and which encodes a fluorescent protein; and

(c) an isolated DNA differing from the isolated DNAs of

(a) and (b) above in codon sequence due to degeneracy of the genetic 10 code, and which encodes a fluorescent protein.

8. The DNA sequence of claim 7, wherein said DNA encodes a fluorescent protein having an amino acid sequence shown in SEQ ID No. 56.

15

9. The DNA sequence of claim 7, wherein said DNA is selected from the group consisting of non-humanized and humanized DNA.

20

10. The DNA sequence of claim 9, wherein said DNA is zFP506 or N65M.

25

11. A vector capable of expressing the DNA sequence of claim 1 in a recombinant cell, wherein aid vector comprising said DNA and regulatory elements necessary for expression of the DNA in the cell.

WO 00/34318

PCT/US99/29291

12. The vector of claim 11, wherein said DNA encodes a fluorescent protein having the amino acid sequence shown in SEQ ID No. 56.

5 13. The vector of claim 11, wherein said vector is constructed by amplifying said DNA and then inserting the amplified DNA into EGFP-N1 backbone.

14. The vector of claim 13, wherein said DNA is selected
10 from the group consisting of non-humanized and humanized DNA.

15. The vector of claim 14, wherein said DNA is zFP506 or N65M.

15 16. The vector of claim 11, wherein said vector is constructed by fusing different mouse ODC degradation domains to the C-terminal of said DNA and then inserting the fusion DNA into EGFP-N1 backbone.

20 17. The vector of claim 16, wherein said mouse ODC degradation domains are selected from the group consisting of d1, d2 and d376.

18. The vector of claim 16, wherein said DNA is selected
25 from the group consisting of non-humanized and humanized DNA.

19. The vector of claim 18, wherein said DNA is zFP506 or N65M.

WO 00/34318

PCT/US99/29291

20. A host cell transfected with the vector of claim 11, wherein said cell is capable of expressing a fluorescent protein.

21. The host cell of claim 20, wherein said cell is selected
5 from the group consisting of bacterial cells, mammalian cells, plant cell, yeast and insect cells.

22. The host cell of claim 21, wherein said mammalian cell is HEK 293 cell.

10

23. The host cell of claim 21, wherein said bacterial cell is an *E. coli* cell.

15

24. An isolated and purified fluorescent protein coded for by DNA selected from the group consisting of:

(a) an isolated DNA which encodes a fluorescent protein from an organism from Class Anthozoa, wherein said organism does not exhibit bioluminescence;

20 (b) an isolated DNA which hybridizes to isolated DNA of (a) above and which encodes a fluorescent protein; and

(c) an isolated DNA differing from the isolated DNAs of (a) and (b) above in codon sequence due to degeneracy of the genetic code and which encodes a fluorescent protein.

25

25. The isolated and purified fluorescent protein of claim 24, wherein said organism is from Sub-class Zoantharia.

26. The isolated and purified fluorescent protein of claim 25, wherein said organism is from Order Zoanthidea.

WO 00/34318

PCT/US99/29291

27. The isolated and purified fluorescent protein of claim
26, wherein said organism is from Sub-order Brachycnemina.

5 28. The isolated and purified fluorescent protein of claim
27, wherein said organism is from Family Zoanthidae.

— 29. The isolated and purified fluorescent protein of claim
28, wherein said organism is from Genus Zoanthus.

10

30. An isolated and purified fluorescent protein coded for
by DNA selected from the group consisting of:

(a) isolated DNA which encodes a fluorescent protein
having an amino acid sequence shown in SEQ ID No. 56;

15 (b) isolated DNA which hybridizes to isolated DNA of (a)
above and which encodes a fluorescent protein; and

(c) isolated DNA differing from said isolated DNAs of (a)
and (b) above in codon sequence due to degeneracy of the genetic
code and which encodes a fluorescent protein.

20

31. The isolated and purified fluorescent protein of claim
30, wherein said protein is zFP506.

25 32. An amino acid sequence which can be used as a basis
for designing an oligonucleotide probe for identification of a DNA
encoding a fluorescent protein by means of hybridizaton, wherein said
sequence is selected from the group consisting of SEQ ID Nos. 3, 5, 8,
11, 12, 14.

WO 00/34318

PCT/US99/29291

33. The amino acid sequence of claim 32, wherein said oligonucleotide has a nucleotide sequence selected from the group consisting of SEQ ID Nos. 4, 6, 7, 9, 10, 13, 15, 16.

INTERNATIONAL SEARCH REPORT

International application No.
PCT/US99/29291

A. CLASSIFICATION OF SUBJECT MATTER

IPC(6) Please See Extra Sheet
US CL Please See Extra Sheet

According to International Patent Classification (IPC) or to both national classification and IPC

B. FIELDS SEARCHED

Minimum documentation searched (classification system followed by classification symbols)

U.S. : 435/ 320.1, 252.3, 252.33, 325, 410, 254.11, 348, 369, 69.1; 530/350; 536/23.5

Documentation searched other than minimum documentation to the extent that such documents are included in the fields searched

Electronic data base consulted during the international search (name of data base and, where practicable, search terms used)

Please See Extra Sheet

C. DOCUMENTS CONSIDERED TO BE RELEVANT

Category*	Citation of document with indication, where appropriate, of the relevant passages	Relevant to claim No.
X, P	MATZ et al. Fluorescent proteins from nonbioluminescent Anthozoa species. Nature Biotechnology. October 1999, Volume 17, No. 10, pages 969-673, entire document.	1-33
X, P	DE 197 18 640 A1 (WIEDENMANN) 22 July 1999, entire document.	24-25, 30

Further documents are listed in the continuation of Box C. See patent family annex.

• Special categories of cited documents:	*T*	later document published after the international filing date or priority date and not in conflict with the application but cited to understand the principle or theory underlying the invention
A document defining the general state of the art which is not considered to be of particular relevance		
B earlier document published on or after the international filing date	*X*	document of particular relevance; the claimed invention cannot be considered novel or cannot be considered to involve an inventive step when the document is taken alone
L document which may throw doubts on priority claims; or which is cited to establish the publication date of another citation or other special reason (as specified)	*Y*	document of particular relevance; the claimed invention cannot be considered to involve an inventive step when the document is combined with one or more other such documents, such combination being obvious to a person skilled in the art
O document referring to an oral disclosure, use, exhibition or other means	*Z*	document member of the same patent family
P document published prior to the international filing date but later than the priority date claimed		

Date of the actual completion of the international search
23 FEBRUARY 2000

Date of mailing of the international search report
17 MAR 2000

Name and mailing address of the ISA/US
Commissioner of Patents and Trademarks
Box PCT
Washington, D.C. 20231
Facsimile No. (703) 305-3230

Authorized officer
GABRIELE ELISABETH BUGAISKY
Telephone No. (703) 308-0196

BEST AVAILABLE IMAGES

Defective images within this document are accurate representations of the original documents submitted by the applicant.

Defects in the images include but are not limited to the items checked:

- BLACK BORDERS**
- IMAGE CUT OFF AT TOP, BOTTOM OR SIDES**
- FADED TEXT OR DRAWING**
- BLURRED OR ILLEGIBLE TEXT OR DRAWING**
- SKEWED/SLANTED IMAGES**
- COLOR OR BLACK AND WHITE PHOTOGRAPHS**
- GRAY SCALE DOCUMENTS**
- LINES OR MARKS ON ORIGINAL DOCUMENT**
- REFERENCE(S) OR EXHIBIT(S) SUBMITTED ARE POOR QUALITY**
- OTHER:** _____

IMAGES ARE BEST AVAILABLE COPY.

As rescanning these documents will not correct the image problems checked, please do not report these problems to the IFW Image Problem Mailbox.
